Reviewer’s report

Title: Percutaneous therapy of a mediastinal lymphangioma with fibrin glue: case report with clinical success after 4 years

Version: 0 Date: 30 Oct 2017

Reviewer: Francesco Pia

Reviewer's report:

We would like to know something about:- are the multiple small cysts communicating with the biggest one? If yes, probably the sclerotherapy is not sufficient.- does the drainage tube drained for 20 days continuously or not? is it a positive suction or not?- Cystic hygromas are benign lesions and can remain asymptomatic in a patient for a long period. You mention 4 years follow-up (also in the title) but there is no radiological imaging after this period (we have only CT images after 1.5 year).

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

No

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Unable to assess

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
