It is an interesting clinical study concerning a large cohort of patients. I suggest to discuss the value of pre-operative CT in assessing contra-indication to a laparoscopic treatment, usually represented by ischemic lesions of intestinal loops, peritoneal effusion, secondary vascular lesions, free air inside the peritoneum, secondary pleural effusion, etc. These elements can be deduced by the personal experience of the Authors, or found through a bibliographic research.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
