Reviewer’s report

Title: Coexistent papillary thyroid carcinoma diagnosed in surgically treated patients for primary versus secondary hyperparathyroidism: same incidence, different characteristics

Version: 1 Date: 15 Jun 2019

Reviewer: Claudio Gambardella

The authors performed an interesting analysis about the incidence and features of Coexistent papillary thyroid carcinoma diagnosed in surgically treated patients for primary versus secondary hyperparathyroidism. It is a debated and interesting topic. The article is well written and concepted. The reference are updated.

In the discussion section in order to better analyze the surgical complications after thyroidectomy I suggest to consider: "Total thyroidectomy alone versus ipsilateral versus bilateral prophylactic central neck dissection in clinically node-negative differentiated thyroid carcinoma. A retrospective multicenter study.

and "Efficacy of combined treatment for anaplastic thyroid carcinoma: results of a multinstitutional retrospective analysis.

After these minor revisions the paper will be suitable for pubblication.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes
Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics

Quality of written English
