Reviewer’s report

Title: Systematic review on the needle and suture types for uterine compression sutures: a literature review.

Version: 1 Date: 09 Sep 2019

Reviewer: Reviewer 2

Reviewer's report:

PEER REVIEWER ASSESSMENTS:

OBJECTIVE - Full research articles: is there a clear objective that addresses a testable research question(s) (brief or other article types: is there a clear objective)?
Yes - there is a clear objective

DESIGN - Is the current approach (including controls and analysis protocols) appropriate for the objective?
Yes - the approach is appropriate

EXECUTION - Are the experiments and analyses performed with technical rigor to allow confidence in the results?
Yes - experiments and analyses were performed appropriately

STATISTICS - Is the use of statistics in the manuscript appropriate?
Yes - appropriate statistical analyses have been used in the study

INTERPRETATION - Is the current interpretation/discussion of the results reasonable and not overstated?
No - there are minor issues

OVERALL MANUSCRIPT POTENTIAL - Is the current version of this work technically sound? If not, can revisions be made to make the work technically sound?
Probably - with minor revisions

PEER REVIEWER COMMENTS:

GENERAL COMMENTS:
Well done methodology for a very difficult area to analyze. the number of reports and patients are not very extensive given the common nature of the problem. Furthermore details of management tend to be sparse.
The authors have determined about as much as possible given the limitations listed above. It is difficult to separate a number of related factors such as suture size and type, or surgeon/center and suture size and type and finally thresholds for transfusions and surgery including hysterectomy.
REQUESTED REVISIONS:
The manuscript would be strengthened if the authors pointed out the weaknesses of this type of analysis, particularly sources of bias. For example there was a much higher transfusion rate ass'd with No 2 vs No 1 suture. Was this all pre suture? if so, then sicker patients, however if post suture, maybe the surgeon/centers that used No 2 were more aggressive in preserving the uterus. Maybe the use of hysterectomy is related to setting- lower resource vs higher resource? There are obviously many sources of bias that should be addressed. While the systematic review suggests the findings indicated, better studies- case controls, cohort, maybe even randomized studies provide better evidence.

ADDITIONAL REQUESTS/SUGGESTIONS:
yes, see above- mention and discuss sources of bias, and the inherent weaknesses of this type of review

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

No

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics

Quality of written English
Please indicate the quality of language in the manuscript:
