Reviewer's report

Title: A new surgical technique for concealed penis using an advanced musculocutaneous scrotal flap

Version: 4
Date: 18 December 2014

Reviewer: Ezekiel Young

Reviewer's report:

Minor Essential Revisions: The tables must still be fixed. In particular there is no reason to include a column of p-values since there are no groups being compared. The p-value column should be removed. Also, the table describing complications should be removed or changed. It is much more efficient to simply state that there were no complications at all after the immediate post-operative period (1st six weeks) instead of listing all those columns full of zeros.

Discretionary revisions: As mentioned in my previous comments, I think this manuscript could be vastly improved by offering a comparison group (ideally comparing it to outcomes from the technique they used before). It appears the authors are not planning on taking that suggestion, and I think the report is still worth publishing without a comparison group but its impact is significantly diminished by that major shortcoming. I also still find the first pane in the diagram to be difficult to understand. Since this paper is essentially a description of a technique, the drawing demonstrating the method is probably the most important part of the paper and so I would recommend improving that image for better clarity.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
