Title: A multi-item Physician Global Assessment scale to assess psoriasis disease severity: validation based on four phase III tofacitinib studies

Version: 0 Date: 19 Oct 2017

Reviewer: Rahul Nagar

Reviewer's report:

The objective of this study was to perform a more intensive and rigorous analysis of the PGA using data from four phase III studies of tofacitinib in moderate to severe chronic plaque psoriasis. The authors also mentioned that there is currently no recognised standard definition of the PGA.

Authors have concluded that results of their study demonstrate that three-item PGA scale is a valid and reliable instrument for evaluating disease severity in clinical studies of psoriasis there is currently no recognised standard definition of the PGA.

A more detailed description of study population is required because the clinical scenarios is different from that in clinical trials; extrapolation of these results in clinical practice will be difficult without such details.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I recommend additional statistical review
