The topic of the study is very relevant. The authors have described the Prevalence of foot ulcers in people with Type 2 diabetes, Presenting to Specialist Diabetes Clinic at a Tertiary Care Hospital, Lahore, Pakistan.

There are some points which needs clarification.

1- Diabetic foot ulcers are usually on the plantar aspect because of neuropathy and increased pressures, however in this study a large no of patients presented with ulcers on dorsal surface. Any explanation for this?

2- Presentation of bilateral ulcers simultaneously is not very common in clinical practice, however in this study 80% patients presented with bilateral ulcers. Need to discuss this finding in detail.

3- Please provide distribution of foot ulcers according to site.

4- Introduction needs to be focused more on diabetic foot.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

No
Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.

I am able to assess the statistics
