Reviewer’s report

Title: Short Stature as a Presenting Symptom of Attenuated Mucopolysaccharidosis Type I: Case Study and Clinical Insights

Version: 0 Date: 25 Sep 2018

Reviewer: Motomichi Kosuga

Reviewer’s report:

Because this paper is mainly targeted at pediatric endocrinologists, authors should emphasize the need of careful observation in evaluating bone age. Bone deformity of MPS generally begins from the infancy. When a patient with MPSI is referred to endocrinologists, dysostosis multiplex including metacarpal pointings and bullet shaped phalanges has already presented. Therefore, it is important not to overlook the presence of hand bone deformity when evaluating bone age.

On page7, line38, authors mentioned the results of the uGAG test indicated in Figure 4. However figure 4 was not attached in this paper.

Minor revise: On page1, MPS I is an abbreviation of mucopolysaccharidosis type I.

Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Unable to assess

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Unable to assess

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Unable to assess

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
