Reviewer's report:

PEER REVIEWER COMMENTS: To view the full report from the academic peer reviewer, please see the attached file.

REVIEWER COMMENTS FROM REPORT: This is a retrospective cohort study to determine the incidence and predictors of lower limb amputation among patients with diabetes in a Tertiary hospital. The data was collected from the medical records of patients enrolled in a diabetes clinic. The study is highly relevant considering how common and devastating lower limb amputation is to patients with Diabetes mellitus and that it is one of the most preventable long-term complication of diabetes if appropriate foot care is provided to patients. The objectives are well narrated and the study design appropriate. The statistical analyses have been described well; the results and discussion are well presented.

REQUESTED REVISIONS:

The study procedure needs to be expanded to provide more information on how cases (LLA) were identified and what constituted "consistency" in follow-up.

ADDITIONAL REQUESTS/SUGGESTIONS:

There is an inconsistency in the interpretation of the results (line 129) -- not all antihypertensives were lower in people with LLA

The sentence in Line 175 appears to be redundant
Are the methods appropriate and well described?
If not, please specify what is required in your comments to the authors.

Yes

Does the work include the necessary controls?
If not, please specify which controls are required in your comments to the authors.

Yes

Are the conclusions drawn adequately supported by the data shown?
If not, please explain in your comments to the authors.

Yes

Are you able to assess any statistics in the manuscript or would you recommend an additional statistical review?
If an additional statistical review is recommended, please specify what aspects require further assessment in your comments to the editors.
