Reviewer's report

Title: Pre-Invasive And Invasive Disease In Women With A Cytological Diagnosis Of High-Grade Lesion And High Grade Lesion Can Not Exclude Microinvasion

Version: 2  Date: 16 November 2014

Reviewer: Ruud LM Bekkers

Reviewer's report:

This is a well written and executed research project to investigate the different implications of a HSIL report or HSIL cannot exclude micro invasion from cervical cytology.

major compulsory revisions:
1. the discussion lacks sufficient references to the literature. Many articles report on the number of LSIL, HSIL, carcinoma histology in case of HSIL cytology, so this has to be added.
2. the authors suggest a more invasive approach in case of HSIL Micro. What is meant with this more invasive approach? and is it indeed advisable, or should you be less invasive by only taking some biopsies first to get a proper histolgical diagnosis. also this needs to be discussed with literature references in the discussion.

Minor points: the english may be improved by a native english speaker.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
