Reviewer’s report

Title: Views and experiences of health care professionals towards the use of African traditional, complementary and alternative medicines among patients with HIV infection: the case of eThekwini health district, South Africa.

Version: 4 Date: 23 February 2015

Reviewer: N Malangu

Reviewer’s report:

Major Revisions:
Remove all tests referring to and about "standard error and relative error"; rather present mean values with their standard deviation and percentages or proportions with no other added values.
The presentation of standard error and relative error is unnecessary and inappropriate for the data presented. The reasons for use and non-disclosure could be well presented in a table or histogram.

Sentences revisions e.g. in the abstract conclusion, the second sentence (line 27+)

Minor revisions:
It would be good for the authors to find out the scientific names of plants cited such as for garlic, cancer bush, ..... and write the correctly

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, and I have assessed the statistics in my report.

Declaration of competing interests:
None
