Title: Effectiveness of Evidence-Based Medicine on Knowledge, Attitudes, and Practices of Family Planning Providers: A Randomized Experiment in Jordan

Version: 2  Date: 9 July 2015

Reviewer: Malcolm Potts

Reviewer's report:

To the best of my knowledge, this is the first RCT exploring the impact of EBM on the biases and misinformation that all too often create barriers between a woman's desire to control her fertility and the information and means she needs to separate sex from childbearing. Such barriers to contraceptive use are widespread and damaging so this paper is important. It is also interesting because it is a negative result.

The writing, study design and statistical analysis are all excellent.

I recommend publication without any changes.
