Reviewer’s report

Title: Detecting and nutritional managing protocol of high-output stomas

Version: 2 Date: 24 February 2015

Reviewer: Monica Millan

Reviewer’s report:

The authors propose a protocol for the management of high-output stomas and perform a prospective study of a cohort of patients with stomas analysing the types of high-output stomas and their management.

The questions posed by the authors are interesting and the protocol is well designed and seems reproducible in other Centres.

The sample is small, however, to reach clear conclusions, and this should be highlighted in the discussion.

However, the main drawback to this study is the quality of written English. It is so deficient that many paragraphs and statements are hard to follow and understand, and this may lead to errors in the interpretation of the results and the discussion. It needs extensive editing before the article can be suitable for publication.

Quality of written English: Not suitable for publication unless extensively edited

Statistical review: No, the manuscript does not need to be seen by a statistician.
