Reviewer's report:

The subject of this paper “Incentives for non-physician health professionals to work in the rural and remote areas of Mozambique – a discrete choice experiment for eliciting job preferences”, is quite relevant because it indicates that the provision of basic government housing has the greatest impact on the probability of choosing a job at a public health facility on rural or remote areas.

About the statistical model used: as a discrete choice experiment (DCE), it has correctly used a conditional logit model to analyze the choice response data. Moreover, the sample size was big enough to enable important conclusions based on high levels of significance.
