Title: Prevalence of Adhesions and Associated Postoperative Complications After Cesarean Section in Ghana: A Prospective Cohort Study

Version: 0 Date: 10 Jul 2017

Reviewer: Vasilios Pergialiotic

Reviewer's report:

The article 'Prevalence of Adhesions and Associated Postoperative Complications After Cesarean Section in Ghana: A Prospective Cohort Study' addresses the impact of adhesions on perioperative outcomes of parturient and neonates.

The article is well organized, the materials and methods clearly described and the statistical analysis quite transparent. The discussion is well designed and the limitations of the study adequately explained to guide future research in this very interesting field. Given these, I find the paper suitable for publication if some minor points are explained

1) The introduction/background section is very vague. It needs to point out the correlation of adhesions with maternal and neonatal complications and the rationale behind this assumption. The indications of CS are already known to the audience. In general adhesions render abdominal surgery very difficult occasionally. The authors should explicitly state this and relate it with the case of CS.

2) Discussion. The authors should further enhance their discussion by adding a section of guidance for clinicians. Given their findings, what should the clinician do to inform the patient? Also which are the available methods of assuming the presence of adhesions prior to CS and how could gynecologists prevent future adhesions (barriers, peritoneal suturing etc)
