Reviewer’s report

Title: A new concept for implant-borne dental rehabilitation or how to overcome the biological weak-spot of conventional dental implants?

Version: 0 Date: 23 Apr 2017

Reviewer: A Hemprich

Reviewer's report:

So far this is only a detailed technical report describing the planning and manufacturing of the described devices. I would recommend to wait with the publication until some animal studies have been successfully carried out.

Even the old subperiostal implants were successful over many years until either exposed or until the "abutments" broke. When such an implant had to be removed usually a large bone defect resulted with many bad consequences for the patient. This may also happen here in spite of CAD/CAM techniques. All this should be added at length in the discussion.

The English language has to be revised. There are many misspelled words.
