Reviewer's report

Title: SEAS (Scientific Exercises Approach to Scoliosis): a modern neurophysiological evidence based approach to exercises for idiopathic scoliosis

Version: 3  Date: 10 February 2014

Reviewer: Thomas Findley

Reviewer's report:

The review addresses some of the multiple details suggested by the reviewers, but misses the main point by marian wade: is this a methodology or a review paper? Since the authors suggested comparison to papers on the schroth method, I have listed one in each category. The authors state that the article is only a brief description of the SEAS approach and is not a review article. They need to follow therefore the methodology outline. For that, the paper needs to be completely rewritten using the comments already given as guidance.

Methodology

Scoliosis short-term rehabilitation (SSTR) according to 'Best Practice' standards - are the results repeatable?

Review

The method of Katharina Schroth - history, principles and current development

Hans-Rudolf Weiss Scoliosis 2011, 6:17 (30 August 2011)

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
