Title: Quality of Life and Patient Satisfaction in Bracing Treatment of Adolescent Idiopathic Scoliosis

Version: 2 Date: 17 Aug 2018

Reviewer: Jean Claude De Mauroy

Reviewer's report:

Thanks for the corrections that improve the quality of the text.

Sorry if I misspoke. The problem is that each item has 5 levels of answers from the patient and the presentation of the results is binary: Psychology 19% unaffected and 81% affected. But we do not know if they are affected "always", "most of the time", "sometimes", "almost never". If the questionnaire was binary "yes / no" the percentage could be different.

If you want to avoid showing in the graph the percentage of the 5 answers, the presentation of the results can be done in the form of a table, with the average of the scores in each domain and if possible the percentiles for example as in the paper of Aulisa. (https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3765932/table/T1/).

Then you can discuss your results, compared to those of the literature.
