Reviewer's report

**Title:** Surgical management of Ventricular septal rupture complicating acute myocardial infarction

**Version:** 1  **Date:** 4 December 2014

**Reviewer:** Junjiro Kobayashi

**Reviewer's report:**

The authors would report the surgical results for postinfarction VSP. Operative mortality was still as high as 36%. This modified surgical procedure did not improve outcomes for VSP. Surgical results were related to the lesion of AMI. Inferior infarction was reported to be a risk factor of mortality, which is not included for Euro II score.

**Level of interest:** An article of limited interest

**Quality of written English:** Needs some language corrections before being published

**Statistical review:** Yes, but I do not feel adequately qualified to assess the statistics.
