Reviewer’s report

Title: Two cases of granuloma mimicking local recurrence after pulmonary segmentectomy

Version: 0 Date: 14 Oct 2019

Reviewer: qian jun

Reviewer's report:

Thank you for your valuable papers for the journal.

1. What is the postoperative pathological stage of case 1? AAH, AIS, MIA or IA, We know that had a very good survival rate at the previous MIA stage. Did you consider these factors when you found a recurrence of pulmonary nodules?

2. Please add the chest CT image after recurrence. In case 2, I can see lung nodules with long burrs, which generally indicates the possibility of benign nodules. If other malignancies are considered lung metastases, they are generally manifested as multiple round nodules along the vascular branch.

3. These nodules after lung surgery and this is like a piece of clothing, you get wrinkles when you sew it up.

4. Pulmonary hemorrhage is a major challenge for thoracic surgeons, and we can consider blocking the pulmonary artery. The right pulmonary artery is deep and can be found below the fourth group of lymph nodes, in front of the trachea and behind the superior vena cava.

Level of interest
Please indicate how interesting you found the manuscript:

An article whose findings are important to those with closely related research interests

Quality of written English
