Reviewer's report

Title: Lack of association between screening interval and cancer stage in Lynch syndrome may be accounted for by over-diagnosis; a Prospective Lynch Syndrome Database report

Version: 0 Date: 13 Feb 2019

Reviewer: Tadeusz Debniak

Reviewer's report:

Herein authors present results suggesting that there is no association between CRC staging and the frequency of colonoscopy surveillance. Due to small numbers of advanced cancers this finding can be regarded as preliminary but is interesting since it supports the thesis of possibility of potential spontaneous regression of CRC in Lynch syndrome. Authors do not evaluate the question of the effectiveness of colonoscopy screening in detection of precancerous and cancerous lesions - they provide no data such as numbers of detected polyps / CRCs and numbers (frequency) of colonoscopy screening.

In summary the paper fulfills criteria needed for publication in HCCP Journal.
