Reviewer’s report

Title: Supervised exercise training and increased physical activity to reduce cardiovascular disease risk in women with polycystic ovary syndrome: study protocol for a randomized controlled feasibility trial.

Version: 0 Date: 09 Feb 2019

Reviewer: JD Schwalm

Reviewer's report:

The authors have presented a well-written protocol for a three-arm RCT that aims to measure the feasibility of evaluating the effects of supervised exercise and reducing sedentary behaviour in women with PCOS on CVD risk versus control. My only concern with this protocol is the limited details regarding the analysis of the secondary outcomes, including oxidized LDL. Will this be a delta in pre-post measurements between groups or absolute LDL values at follow-up? This needs clarification.

Level of interest
