Reviewer's report

Title: Multiple Intracardiac Masses: Myxoma, Thrombus or Metastasis: A Case Report

Version: 4 Date: 21 March 2015

Reviewer: Akihiko Ikeda

Which of the following best describes what type of case report this is?: Unexpected or unusual presentations of a disease

Has the case been reported coherently?: No

Is the case report authentic?: Yes

Is the case report ethical?: Yes

Is there any missing information that you think must be added before publication?: No

Is this case worth reporting?: No

Is the case report persuasive?: No

Does the case report have explanatory value?: No

Does the case report have diagnostic value?: No

Will the case report make a difference to clinical practice?: No

Is the anonymity of the patient protected?: Yes

Comments to authors:

The authors performed cardiac MRI, which showed that the cardiac masses did not invade the cardiac walls. Therefore, I think that the preoperative diagnosis did not include metastatic tumors. In addition, if the lung mass was pulmonary embolism, preoperative CT could diagnose it.

I think that the interesting point of this case was a RA myxoma with LV and LA thrombi, and pulmonary thromboembolism which were resolved by anticoagulation therapy. The differential diagnosis was not uncommon. If the authors hope to accept the manuscript, they should change the concept of the manuscript.

Level of interest: An article of limited interest
Quality of written English: Needs some language corrections before being published
